

• BUILT ON CLAUDE. BUILT FOR OPERATIONS.

The same intelligence. Reliable enough to run a law firm on.

Claude Code and Claude Cowork can build an automation. But a law firm cannot run on shadow AI. Caddi is the governed version of the same intelligence, and for a firm that is the whole difference: every run is auditable by IT, client data stays yours with zero retention, and each automation belongs to the firm, not the one person who built it.

THREE TOOLS, ONE INTELLIGENCE

CHECK = DOES IT, OUT OF THE BOX

CAPABILITY	Claude Cowork	Claude Code	Caddi
WHAT EACH IS FOR			
Complex, one-off work	✓	✓	—
Claude AI Model	✓	✓	✓
Files & sorts docs	✓	✓	✓
WHERE CODE AND COWORK DIFFER			
Builds automations	—	✓	✓
Any non-technical user	✓	—	✓
ONLY CADDI			
Pre-built 80+ integrations	—	—	✓
Runs 24/7 in the cloud	—	—	✓
Self-improving	—	—	✓
Full audit logs	—	—	✓
Zero data retention by default	—	—	✓
Low cost, minimal token use	—	—	✓

“We do not want to sit and prompt. We want the work to just happen, and to trust it happened right.”

• GOVERNED AI VS SHADOW AI

But couldn't we just **build it ourselves?**

The questions that decide whether a homegrown automation survives contact with a real firm.

01 Can't we just have someone build this with Claude?

You can, and the demo will work. Then it breaks, and only the person who wrote it can fix it. That is fine for one script, and a real problem the moment the firm depends on it.

02 What happens when it breaks?

A vibe-coded automation fails quietly and waits for its author. Caddi watches its own runs, catches the break, and repairs its own code, with a logged record of what changed.

03 Why won't it scale past the person who built it?

Fifty scripts, written by people who changed teams or left, is fifty black boxes no one can see or audit. Caddi automations belong to the firm, not a person, so they outlast whoever built them.

04 Is our client data safe?

To get it working, the AI grabs whatever free tool or library fits and auto-mode just installs it, so client data ends up flowing through third parties no one vetted or even knew were added. Caddi runs on a vetted stack with zero data retention, so nothing touches a service you did not approve.

05 Can IT actually govern it?

Shadow AI is invisible to IT by definition. Every Caddi run is permissioned, logged, and auditable, so compliance can prove exactly what happened.

06 So what is Caddi, in one line?

The same Claude intelligence, made into governed, self-maintaining automation a law firm can run on.
